

DFA vs. NFA

DFA	NFA
<ul style="list-style-type: none">- Given the current state, we know what the next state will be- Has only one unique state- Has no choices or randomness- Easy and simple to design	<ul style="list-style-type: none">- Given the current state, there could be multiple next states- Next state may be chosen at random- All the next states may be chosen in parallel

NFA

$L = \{ \text{Set of all strings that end with 0} \}$

If there's any way that ends in any set of states out of which at least one state is a final state, then it's a valid NFA

$L = \{ \text{Set of all strings that start with 0} \}$

$= \{ 0, 00, 01, 000, \dots \}$

Construct a NFA that accepts sets of all strings over $\{0,1\}$ of length 2

$\Sigma = \{ 0,1 \}$

$L = \{ 00, 01, 11, 10 \}$

NFA

Ex 1) $L1 = \{ \text{Set of all strings that ends with '1'} \}$

Ex 2) $L2 = \{ \text{Set of all strings that contain '0'} \}$

Ex 3) $L3 = \{ \text{Set of all strings that starts with '10'} \}$

Ex 4) $L4 = \{ \text{Set of all strings that contain '01'} \}$

Ex 5) $L5 = \{ \text{Set of all strings that ends with '11'} \}$

NFA

- $L1 = \text{set of all strings over } \{0,1\} \text{ that ends with } 1$
- $L2 = \text{set of all strings over } \{0,1\} \text{ that contains } 0$
- $L3 = \text{set of all strings over } \{a,b\} \text{ that starts with } ba$

1.

$\Sigma = \{0,1\}$

3.

$\Sigma = \{a,b\}$

2.

$\Sigma = \{0,1\}$
